FIRE DRILL - COATINGS THAT PROTECT COMMERCIAL BUILDINGS - AND SAVE LIVES

Sean Younger and Jim Rippe recently wrote an article featured in the July edition of Durability & Design magazine titled "Fire Drill - Coatings that Protect Commercial Buildings - and Save Lives".

The article pertains to how steel construction provides engineers and designers with greater flexibility than traditional concrete construction methods and has become the preferred method for commercial infrastructure construction projects. Along with this trend, fire-resistive materials have been developed to protect steel structures and in the event of a fire, protect infrastructure assets from collapse, maintain paths of egress for occupants to exit buildings safely, and ultimately save lives.

You can reference the article at Durability & Design magazine's website:
